

1. Variables:

- Numerical variable: Price, Age_08_04, KM, HP, Quarterly Tax, Weight, CC
- Categorical variable: doors, gears

2. Distribution of Price (output)

Distribution slightly skewed to the right, with outliers

Price > RM 30000 for sports cars

3. Distribution of numerical variables

i) CC

For variable 'CC', there is extreme value of 16000CC, which is mistyped into data frame, so the value will be replaced with 1600CC, which is also the median value of 'CC'.

ii) Age – Highest frequency around 60-80

iii) KM – Skewed to the right

iv) HP – outlier value (around 190 due to sports car)

v) Quarterly Tax

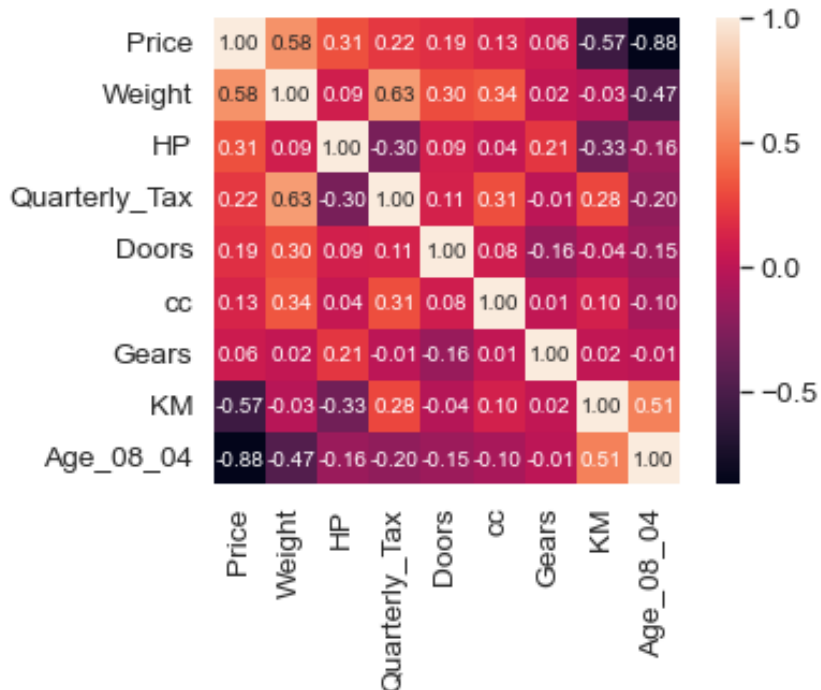

Mode at 85, highest tax at 280

vi) Weight

4. Multicollinearity between variables based on heatmap:

- Price is highly correlated with Age
- Correlation between Weight and Quarterly Tax is 0.63
- Correlation between Price and Weight is 0.58
- Correlation between Price and KM is -0.57
- Correlation between Age and KM is -0.51
- Gears and Price have lowest correlation

i) Cars with 5 gears are the most cars sold, followed by cars with 6 gears.

ii) Cars with 5 doors sold with higher price range (5000 – 30000), followed by cars with 3 doors (5000 – 20000+).

Based on observation, correlation between independent variables are low. All features do have correlation with dependent variable (Price).

R^2 (after replacing outlier in CC) = 0.869

Scatter plot of Price against Age – Apply polynomial transformation on Age

R^2 (after polynomial transformation on Age) = 0.888

Consider only the below columns and prepare a prediction model for predicting Price.

```
Corolla<-Corolla[c("Price","Age_08_04","KM","HP","cc","Doors","Gears","Quarterly_Tax","Weight")]
